

Environmental Profile

Neo Gloss & Satin A2 Art Paper

Supplier Moorim Paper, Korea Site Jinju Mill
Website www.moorim.co.kr/english/ Date March 2008

Fibre Source

The Neo Gloss & Satin range is FSC (COC) Mixed Sources accredited. All fibre used in the production of Neo is purchased from sources approved by FSC, PEFC or CSA and operating under the framework of ISO14001 environmental standards. Moorim Paper has made a commitment to plant more trees than they use in production. They are currently developing plantations in China and Russia.

Bleaching

All pulp used in the production of the Neo Gloss and Satin range is elemental chlorine free. Moorim Paper uses oxygen in the bleaching process to eliminate the harmful environmental effects of chlorine.

Energy Source

Moorim Paper operates a "Smokeless Plant". Power is generated from Liquefied Natural Gas and steam captured from within the mill. Moorim has entered a voluntary agreement with the Korean Government to make reductions in their power consumption and greenhouse emissions. They have enacted this agreement through initiatives such as, increasing the use of steam captured from the paper making process in electricity generation and the installation of more energy efficient boilers.

Waste Water

Moorim Paper uses an environmentally friendly three step waste water treatment process. The process includes chemical treatment, micro-organism treatment and penton treatment. It ensures minimal impact is made on local waterways. Developed by Moorim, this process is now used by a number of paper manufacturers in Asia and around the world.

Mill and Product Environmental Labelling

Moorim Paper conducts all operations under ISO14001 environmental standards. They are recognised by the Korean Government as leaders in environmental management and continue to work hard to minimise their impact on the environment. The Neo range has been awarded the KOECO environmental accreditation.
